PlanSwift Slow Screen Refreshes in Citrix

When using PlanSwift takeoff software inside of a Citrix session, the refresh/redraw rate may appear slow, particularly over low-bandwidth Internet connections.

To improve PlanSwift performance inside of a Citrix session, follow these steps:

- Click on Settings (located in the ribbon bar) and select Graphics in the left tree view.
 Adjust the Image Optimizations options. The recommended selection is Antialias Buffer with Load In Thread only checked, but the No Antialias option might be faster for some users.

— Data Storage — General	Graphics
Company Keyboard Hotkeys Interface Zoom / Pan Annotations Graphics Takeoff Tools Snapping Notifications Digitizer Tablet Property Groups Advanced	Show CAD Drawings with black background (Inverted) Automatically optimize large B&W images - faster navigation (recommended) Convert Colored CAD (DWG/DXF) Drawings to Black & White Image Optimizations No Antialias (Fastest, but lowest quality) Caution, some lines may not show if you are zoomed out too far Antialias Buffer (Better quality, but a little slower) Use Temp file (uses less memory, but a little slower) Load in thread (image will load fast, then antialias shortly after) Halftone (Lowest memory usage, but slower) Do not Antialias while panning/zooming
