

DaaS 3 - Thin Clients

DaaS Hardware - The Thin Client

Evolve IP recognizes that thin clients are used by our customers to provide the local compute hardware used with a DaaS deployment. Remarkably compact, lightweight and low power consumers, thin clients offer many years of efficient, secure and high performance service. Thin clients have many configuration options and are produced by several vendors.

While it would be impossible for Evolve IP to list all name-brand thin clients currently in production today that are usable with your DaaS environment - we can show you a few links to some of the most popular brands to help you identify your working BIOS, OS and Firmware versions to assist you in updating your devices.

Below are details for Dell and 10ZiG options and resources provided by the DaaS vendors, VMware and Citrix, about thin client compatibility with our DaaS products.
